Abstract

The invention relates to an organic electroluminescent device comprising a light emitting layer sandwiched between a pair of electrodes, and characterized in that the light emitting layer contains a light emitting layer material, a 1st dopant and a 2nd dopant that satisfy the following relations, i.e. EV0>EV1 and EV0>EV2; EC0>EC2; Eg0>Eg1, Eg2, where EV0, EV1, and EV2 represent the valence band energy levels of the light emitting layer, the 1st dopant and the 2nd dopant, resp. and likewise EC and Eg indicate the conduction band energy level and the band gap energy, resp.

Abstract

The invention refers to a white electroluminescent device comprising a blue luminescent layer and a yellow-red luminescent layer, wherein the blue luminescent layer is placed closer to the anode in order to counteract the tendency of the device toward the red color so that the yellow-red luminescent layer may be made thicker without affecting the color of the light.

Abstract

The invention refers to an organic electroluminescence device comprising at least one organic thin-film layer with a laminate containing a metal complex with energy gap > 2.8 eV, and a host material layer. The electroluminescence device exhibits a high luminance and has high emission efficiency and a long life.

Abstract

Novel styryl compds. I or II; and an organic electroluminescent device with an organic compound film comprising at least a light emitting layer, wherein a novel styryl compound described above is contained in ≥ 1 layer constituting the film: I and II (wherein R1 to R10 are each independently H, alkyl, alkoxy, aryl, aryloxy, a fused polycyclic group, a heterocyclic group, amino, alkylamino, arylamino, cyano, nitro, hydroxyl, or halo, or alternatively any adjacent 2 of R1 to R10 may be united to form a saturated or unsatd. C ring; and A, B, C, D, A', B', C' and D' are each independently a substituted or unsubstituted alkyl or aryl group having a specific structure). The invention provides organic electroluminescent devices exhibiting high heat resistance, high light emitting efficiency, long lifetime and high blue color purity, and novel styryl compds. capable of realizing such electroluminescent devices.

Abstract

The devices having a high luminescent efficiency, a long life and a high heat resistance comprise I (A = (substituted) C22-60 arylene; X1-4 = (substituted) C6-30 arylene; Y1-4 = II; a-d = 0-2; R1-4 = H, (substituted) alkyl, (substituted) aryl, cyano; R3 may be bonded to R4 to form a triple bond; Z = (substituted) aryl; n = 0, 1).
